### Study: Tax abatements benefit wealthier more than low income areas

 By **JEFF ORTEGA**

Dix Capital Bureau

COLUMBUS - More job creation and private investment associated with Ohio's enterprise zone program have occurred in high-income areas than low-income areas, a new study says.

The enterprise zone program, which lawmakers could consider to renew in the next few years, asks local governments to define zones where businesses may locate or expand and receive long-term property tax abatements. Businesses must guarantee a certain number of jobs are created to receive tax incentives.

"This study finds that lower-income (school) districts are slightly more likely to participate in the program, but higher-income districts reap most of the jobs and investment associated with the program," said the study, released by Policy Matters Ohio, a Cleveland-based, non-partisan research organization.

The study controlled for population and other factors and used public districts as the geographical areas for analysis. "It's become a tool for cities that are hardly distressed," Mark Cassell, the Kent State University assistant professor of political science who conducted the study, said of the enterprise zone program. "Wealthier communities can now use this program to compete for businesses."

Controlling for race and levels of urbanization, the study found that a "low-income" district, with an average household income of \$21,910 annually, is expected to have 14.98 new enterprise zone-related jobs and \$658,466 in related property investments for every 1,000 residents.

That compares to a so-called "high-income" district, with an average household income of \$65,000 annually, which is expected to have 28.20 new enterprise zone-related jobs and \$1.774 million associated property investment per 1,000 residents, the study said. The study also found:

- Districts with a higher percentage of urban residents had less personal property investment as compared to districts with lower percentages of urban residents.

- Very high-income districts were likely to receive twice as many new tax-abatement related jobs as very low-income districts.

- Very high-income districts were likely to receive nearly five times as much tax-abatement related property investment as very low-income school districts.

Researchers examined Ohio Department of Development data compiled through economic

development directors, tax incentive review councils and the National Center for Education Sta to compile the study.

The study was funded by the Ohio Urban University Program. State development department o say they were unaware of the study, but said the enterprise zone program was working as it wa intended.

“I think it’s working the way it’s been created in the statute,” said Carrie Richards Manno, man the development department’s Office of Tax Incentives.

Manno said the department hasn’t done a study similar to Policy Matters Ohio.

Manno said the state has between 355 and 360 enterprise zones in use. ●
